Batch Volume Filter

The batch Volume filter allows you to only include the Customers, Media Types, Volumes, Repositories and Flags required for the process you are running.

This allows not only exclusion of unwanted data but lowers the processing time.

Syntax

```
customer_filter.media_filter.volume_filter@repository_filter+flags!flags
```

- `customer_filter`
- `media_filter`
- `volume_filter`
- `repository_filter`
- `flags` allow you to filter volume flag values, where + is set flags, and `!` are unset flags.

Examples

List all LTO Volumes in the offsite repository that are scratch and not encrypted.

```
-V "*.LTO.*@OFFS+Z!E"
```
