Overview

When you establish a connection to a TapeTrack Framework Server, you must first login to establish your identity.

Native and Active Directory Credentials

TapeTrack supports both native and Active Directory credentials.

Native passwords are MD5 encoded and stored in the TapeTrack database.

When authenticating via Active Directory, the password sent to the TapeTrack Framework Server will then be sent to the Windows Domain Controller for authentication.

Kerberos Single Signon

TapeTrack supports Kerberos Single Singon.
