The tapemaster User

The tapemaster User is a User that is automatically created when a new TapeTrack Database is created and initialized.

Initially the password for this User is blank, but the password should be reset to a strong password as a priority after installation.

In the event that the tapemaster User is deleted, it will be automatically re-created when the TapeTrack Framework Server is restarted.

When the User profile for tapemaster has an Active Directory Domain Name set in it's options, the user is mapped against the Windows Administrator User.
