Volume Flag Filters

Flag Filters With TapeMaster

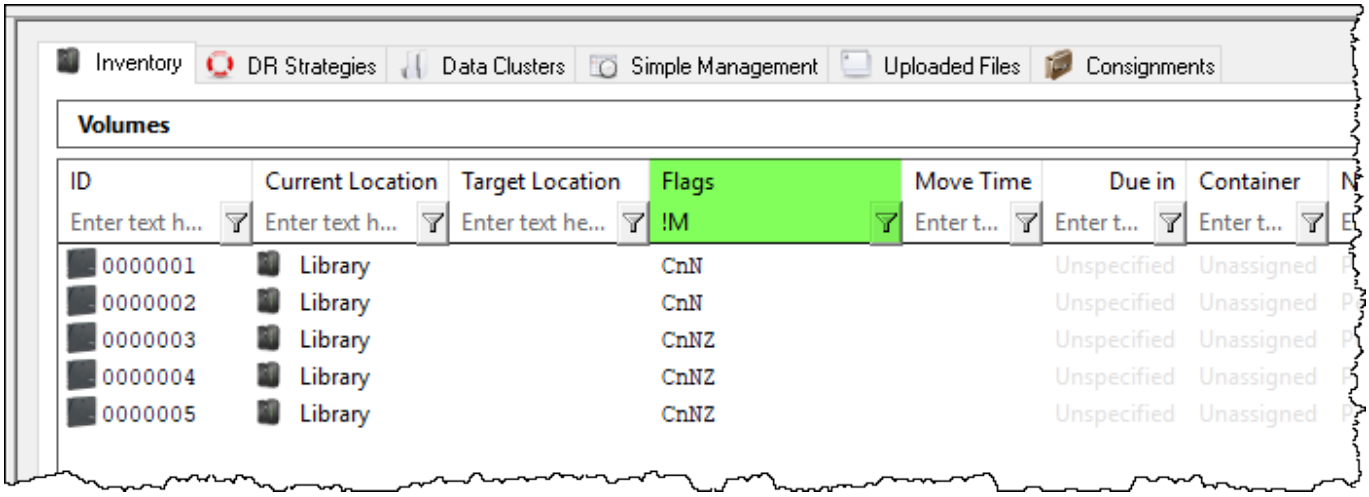

Flags can be used to quickly and effectivley filter the volumes displayed based on their current status.

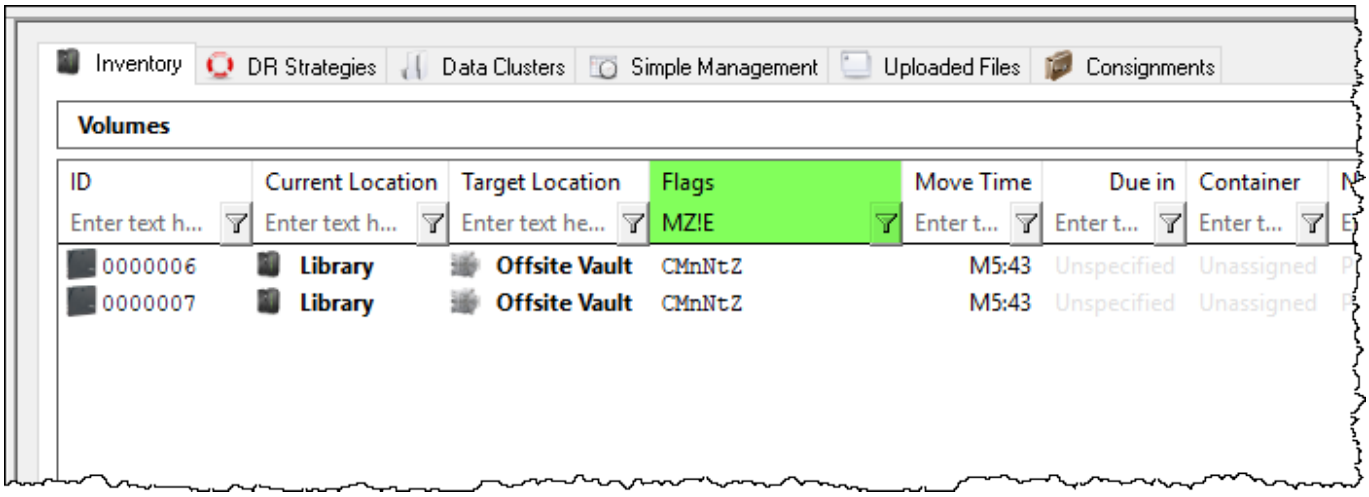

For example, placing **M** in the flag filter field will display all volumes currently in a move status.

Placing a **!M** will show all volumes NOT in a move status.

Flag filters can be used concurrently to filter volumes off multiple flags. For example volumes in a move status, that are Scratch and are not encrypted would use a flag filter of **MZ!E**.
