

Commvault

[Commvault](#) software is an enterprise-level data platform that contains modules to back up, restore, archive, replicate, and search data.

Storage Information Report

The Storage Information Report is created via the Commvault GUI and output to CSV format, accessible from the reports tab.

Report Details - General tab.

The screenshot shows the 'Saved Reports' dialog box with the 'Report Details' tab selected. The 'General' sub-tab is active, displaying various configuration options for the Storage Information Report. The 'Group By' dropdown is set to 'Barcode'. The 'Media Status' section has checkboxes for All, Active, Spare, Read Only, Bad, Retired, Cleaning, Full, Appendable, Undiscovered, Foreign, and Overwrite Protected, all of which are checked. The 'Include' section has checkboxes for Job ID, Aged Data, Error and Usage, and De-configured Clients Only, all of which are unchecked. The 'Show' section has checkboxes for Empty Slots, Media with Error Only, and Media With Prevent Export Only, all of which are unchecked. The 'Retained By' section has checkboxes for Extended Retention Only and Basic Retention Only, both of which are unchecked. The 'Show Resource Pool Information' checkbox is also unchecked. At the bottom, there are buttons for OK, Cancel, Save As Script, and Help.

Saved Reports

Synchronization

You will need to install the [TapeTrack Sync software](#) to complete these instructions.

Synchronization with TapeTrack is performed by calling the [TMSS10Sync](#) command line program, along with:

1. The Storage Information CSV report.
2. Command line arguments that instruct the program how to process volumes.
3. A synchronization definition file that instructs the program how to interpret the Storage Information CSV output.

Example Command Line Arguments

```
<sxh plain;> TMSS10Sync -d default.ttidef -a -S batch:-password@server < commvaultreport.csv
</sxh>
```

Where:

- -d is the path to the Synchronization Definition File.
- -a tells the program to add new tape volumes if they are encountered.
- -S tells the program what [Server](#) to connect to.
- commvaultreport.csv is the Commvault output.

Example Synchronization Definition

```
<sxh> # # Set delimiter SetCSVDelimiter(",");

# Set Customer-ID SetLiteral(CUSTOMER, "1002");

# Set Media-ID SetLiteral(MEDIA, "LTO");

# Extract values Extract(VOLUME, 1, 6, 0); Extract(DESCRIPTION, 5, 50, 0); Extract(EXPIRYDATE, 7,
```

```
10, 0); Extract(WRITETIME, 13, 20, 0); Extract(MOVEDATE, 7, 10, 0);
```

```
# Add L5 suffix to barcode value AddTranslation(VOLUME, "*", "*L5");
```

```
# Declare date formats SetExpiryDateFormat("m/d/Y"); SetMoveDateFormat("m/d/Y");  
SetWriteTimeFormat("m/d/Y H:M:S");
```

```
# Set start of data AddString(START, 0, "A1*");
```

```
# Exclude any line that starts with a space AddString(EXCLUSION, 0, " *");
```

```
# Set end of data AddString(END, 0, "Notes:");
```

```
</sxh>
```
