# Data Protector Sync Cookbook

Data Protector is a HP enterprise backup solution and is available for Windows, UNIX and Linux.

## The omnirpt command

The onmirpt command is available on systems with the Data Protector User Interface component installed.

The `omnirpt` command generates various reports about the Data Protector environment

<sxh> omnirpt -report media_list -tab > var\dataprotector.txt </sxh>

### Example omnirpt output

### Converting omnirpt tab file to Fixed length file

Output from omnirpt, while tab delimitered, can produce offset columns depending on string lengths. To ensure the column offsets are consistent the output is passed through TMSS10CSV2Fixed.

Run TMSS10CSV2Fixed directing the file `dataprotector.csv` through `stdin` to get a starting point for columns and offset values, adjust the offsets to match the data you wish to import, omitting data from irrelevant columns with the offset 0 0.

<sxh> TMSSDELIMETER=TAB

TMSS10CSV2Fixed < dataprotector.csv </sxh>

<sxh>

```
           System: TapeTrack
```

Report Description: CSV Statistics

```
  Production Time: Monday, October 01, 2018 - 13:46:07 (AUS Eastern Standard
Time)
     Report Width: 120 bytes
```

Seq. Min. Max. Heading Value —– —– —–
——————————————————————————————-

```
   0    11    27 # Medium ID
   1     5    19 label
   2     0     8 location
   3     4    28 Status
   4     9    20 Protection
   5     9    10 Used [MB]
   6    10    20 Total [MB]
   7     9    20 Last Used
   8     4    11 Pool
   9     4    11 Type
```

</sxh>

Changing the offset values to pick up volume ID (column 2, offset 30 length 8), location (column 3, offset 48, length 8) and description (column 9, offset 160, length 12).

# Synchronization

You will need to install the TapeTrack Sync software to complete these instructions.

Synchronization with TapeTrack is performed by calling the TMSS10Sync command line program, along with:

1. The fixed width text file produced by pre-processing the onmirpt output.
2. Command line arguments that instruct the program how to process volumes.
3. A synchronization definition file that instructs the program how to interpret the omnirpt output.

## Example Command Line Arguments

<sxh plain;> TMSS10Sync -d dp.ttidef -a -S batch:-password@server < dataprotectorFixed.txt </sxh>

Where:

- `-d` is the path to the Synchronization Definition File.
- `-a` tells the program to add new tape volumes if they are encountered.
- `-S` tells the program what Server to connect to.
- `dataprotectorFixed.txt` is the `omnirpt` output that has been pre-processed through the TMSS10CSV2Fixed program

## Example Synchronization Definition

<sxh> # # Set the Customer and Media as literal values as they never change # SetLiteral(CUSTOMER, “ACME”); SetLiteral(MEDIA, “LTO”); # # Get the Volume-ID # Extract(VOLUME, 1, 6, 0); # # Get the Repository from a translated location Name # Extract(REPOSITORY, 17, 10, 0); RemoveSpaces(REPOSITORY); AddTranslation(REPOSITORY, “*Lib*”, “LIBR”); AddTranslation(REPOSITORY, “*”, “OFFS”); # # Set the Description to the Pool Name # Extract(DESCRIPTION, 36, 40, 0); RemoveSpaces(DESCRIPTION); #
