Removing Volumes From A Container

Volumes can be removed from an assigned container from the volume inventory window, container inventory window, container properties window and automatically via repository property options.

Removing Volumes Through The Inventory Window

Volumes can be deassigned from a container from the perspective of selecting the volumes and then removing them from a container, or selecting a container and then removing the volumes.

Selecting volumes and removing from a container

Selecting a container and removing volumes

Volumes can also be automatically deassigned from a container triggered by confirmation of a container move from one repository to another.
