AddTranslationFromFile

Translate the value of a field based upon the current value of the field, where the current value can be loaded multiple times using the contents of a file.

Phase

This instruction is used by the TapeTrack Import Engine.

Syntax

```
AddTranslationFromFile(field, filterfile, translation);
```

string field;
string filterfile;
string translation;

field	The field to be translated.
filterfile	A file containing filter values to compare against the current field value.
translation	The new value of the field. This can either be a new literal value, or the original value with a prefix or suffix.

See the notes section for AddTranslation.

Example

AddTranslation2FromFile: Append L3 to each VOLUME field if the value matches a pattern within a record of c:\data\LTO3Volumes.txt.

```
AddTranslationFromFile(VOLUME, “c:\data\LTO3Volumes.txt”, “*L3”);
```

import engine, sync engine
