

Adding and Maintaining Disaster Recovery Strategies

Overview

A Disaster Recovery Strategy, referred to in TapeTrack as a “DR Strategy”, is a list of Volumes necessary to restore a system back to a given time in the event of catastrophic system failure. Typically, these DR Strategies are automated through TapeTrack Sync's integration with your back-up software; however, they can be manually created as well.

Creating a DR Strategy

DR Strategies can be manually created in the DR Strategies Administration Tab by: Right-clicking and selecting “Insert” or by pressing the “Insert” key on the keyboard. This will launch the DR Strategy Creation window.

The DR Strategy Creation window will prompt for a description and provide tabs that offer the ability to take notes regarding a DR Strategy and also some various options. A full summary of these options can be found under the Edit DR Strategy page.

To create a DR Strategy, enter a description and click “Save”. The new DR Strategy will appear in the DR Strategies Administration Tab.

Edit DR Strategy

Identity Notes Options

Attributes

Customer: US02 Los Angeles Data Center

Recovery Point: Unestablished

Description: LA Recovery Data

Attachment

Return to Inventory Administration Tab Volume List and select the volumes that should be included in the new DR Strategy. Right-Click the highlighted items and select Edit → Copy → Volumes.

Return to the DR Strategies Administration Tab and double-click or right-click the newly created DR Strategy and select "Properties" to launch the Edit DR Strategy window.

A new tab will appear that was not in the DR Strategy Creation window called "Item List". Select this tab. Right-click and select Edit > Paste. The Volumes that were selected in the Volume List will appear in Item List. If these Volumes are not in a Repository that is set as off-site, their status will appear as "Volume is NOT off-site".

Once the volumes are moved to an off-site Repository, the DR Strategy will gain a status of "OK".
