Allow Overlaps

The Repository Option `Allow Overlaps` allows internally overlapping Zone locations to be assigned to this Repository.

Allow Overlaps Options

- `True`: Allow overlapping Zone allocation.
- `False`: Disallow overlapping Zone allocation.

Allow Overlaps controls whether two or more Zones within the same repository may contain overlapping slot ranges.

When set to True, TapeTrack permits the same slot numbers to be included in multiple Zones.

Example:

Zone	Slot range
LTO	1–100
DAILY	50–75

Slots 50–75 overlap and belong to both Zones. TapeTrack will only allow this configuration when Allow Overlaps is enabled.

This can be useful when Zones represent different classifications or logical groupings rather than exclusive physical areas.

Setting	Result
False	Zone slot ranges must not overlap
True	Multiple Zones may include the same slot locations

It does not allow two tapes to occupy the same physical slot. It only allows Zone definitions to cover some of the same slot numbers.

Generally, leave it False when Zones represent separate physical rack areas. Enable it only when overlapping logical Zone definitions are intentional
