Windows File Structure

Default installation for TapeTrack Sync is on C drive, but may be customised, in the TapeTrack directory.

```
C:\Program Files\TapeTrack\TapeTrack Sync
```

The Sync directory format has the folders:

- `bin`: Command line executables
- `etc`: Location for Sync ttidef files, includes sample.ttidef
- `reports`: Output reports from Sync processes and command line executables
- `scripts`: Location for Sync scripts, includes permissions.bat and sample.bat
- `var`: Input source files, includes sample.csv

Conforming to this file layout for Sync inputs and outputs allows you to use relative file paths rather than absolute file paths. This increases the ease of reusing or moving the files between servers.

Sync call example using the default file structure:

```
TMSS10Sync -S user:-password@server_address -a -d ../etc/default.ttidef <
../var/source_input.csv > ../reports/sync_stdout 2>
../reports/sync_stderr.txt
```
