Adding Registry Key For Desktop Software Start-up Conformation

A registry key can be added to display a pop-up window on execution of TapeTrack Software to help diagnose if there is any software on your computer blocking it from running.

Editing The Registry Precautions

Changes made to the Windows registry happen immediately, no backup is created automatically. Do not edit the Windows registry unless you are confident about doing so.

Files for the Desktop software have been engineered to add the keys without you needing to manually edit the Registry, minimizing the risk of making any errors and making the process as simple as double-clicking the .reg file and answering the following prompts.

Ensure you take a backup of the Registry before making any alterations.

Adding Registry Key

The process to add the key is the same for all TapeTrack Desktop software, however, the location of the key differs for each program. Select the links below based on which Desktop software you want to add or remove the Registry key for.

Add or remove key to Registry for Lite

Add or remove key to Registry for TapeMaster

Add or remove key to Registry for CheckPoint

technote, lite, registry
