Changing Connection Port Allocation

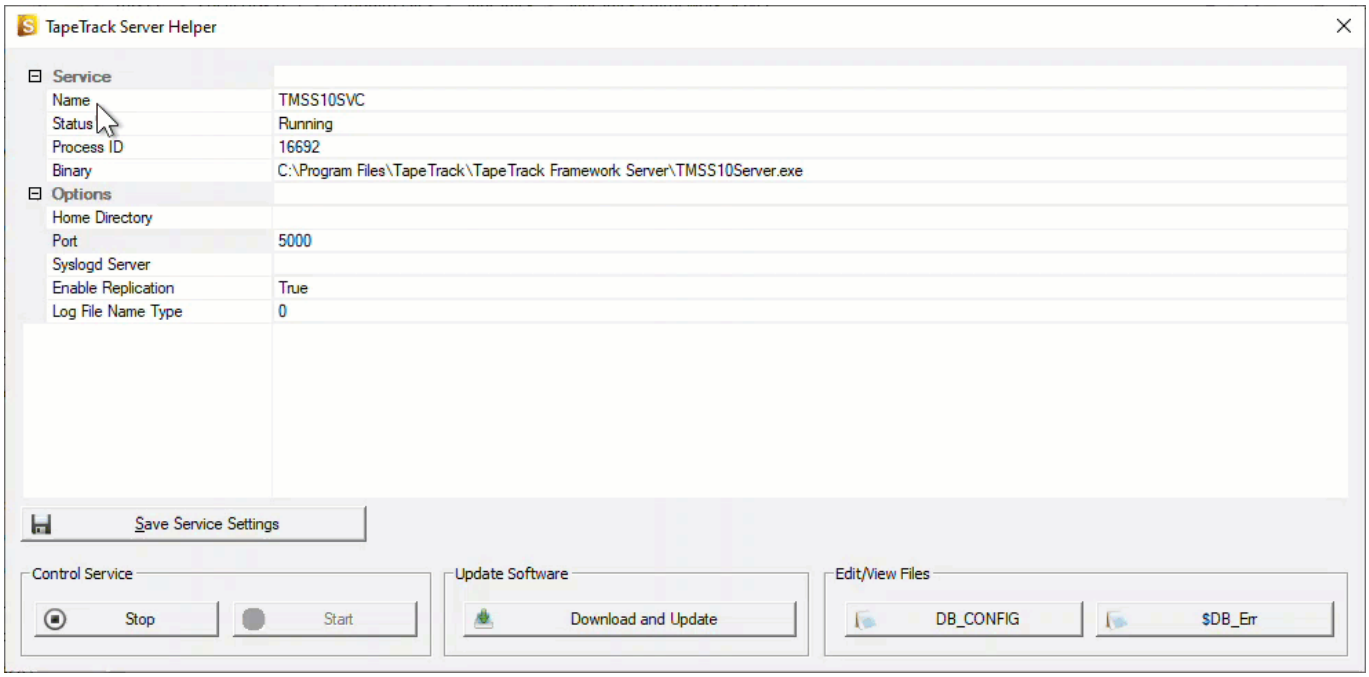

During an upgrade or migration of your TapeTrack Server you may choose to change which port the Framework communicates with the Desktop Client programs.

Changing Framework Server Port Allocation

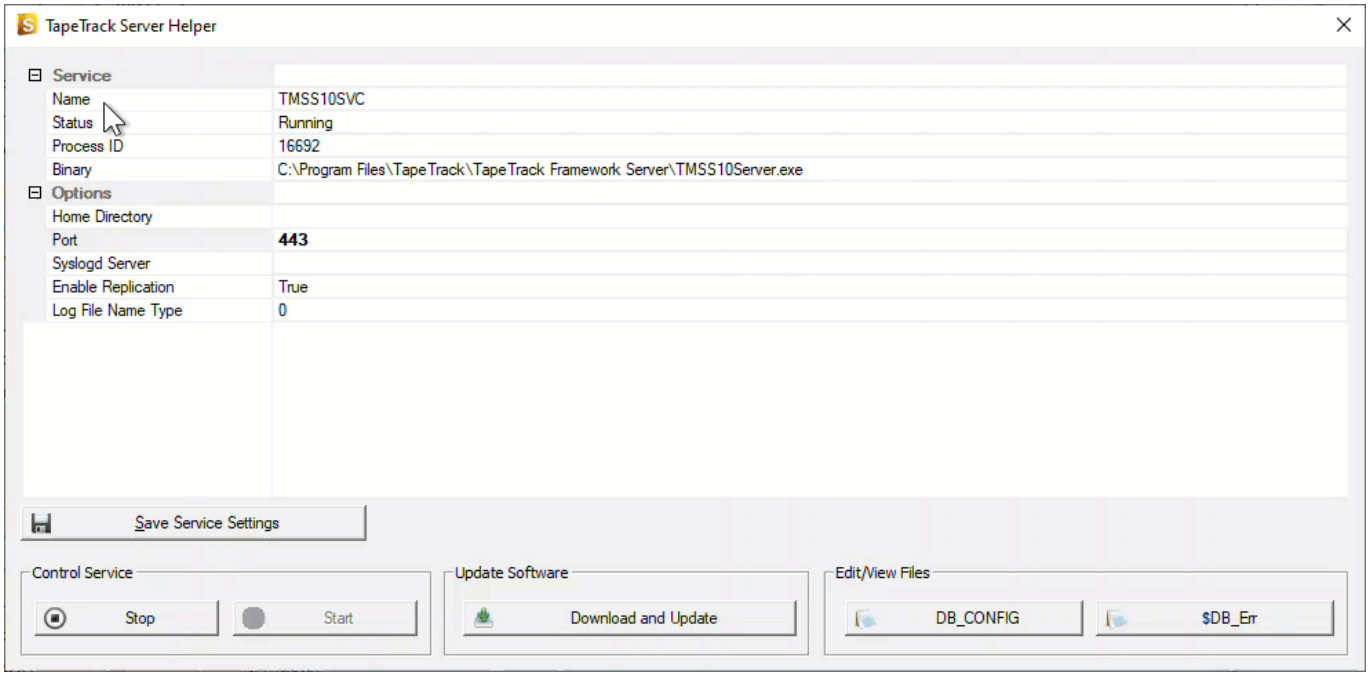

Open the Framework Server Helper which is installed in the directory TapeTrack\TapeTrack Framework Server, (default location C:\Program Files\TapeTrack\TapeTrack Framework Server) by double clicking on the executable `TMSS10ServerHelper.exe`.

Change the port number in the field `Port` under the `Options` section to the required port number, in this example from port 5000 to 443.

Click `Save Service Settings` to update the data.

Stop and then start the TapeTrack Service to allow the Framework Server to access the new port.
