Report Output Formats

Output from the Command Line Utilities can be redirected to a file, the default format being a text file. Using Variables the output can be formatted to CSV, Excel, PDF, HTML or XML files.

Along with the file format, output path and headings can be customized, columns can be omitted from the report, output file name customized and portrait or landscape orientation, and customized logo for PDF formats.

All the following examples show the code necessary to run a report in a command line window. The code can also be placed in a batch file which can then be run at any time, either manually or scheduled to run autoamtically.

Text File

Capturing the output from Command Line Utilities is as simple as redirecting the standard output and providing the file name and directory path you want the file written to.

Example

Using TMSS10Inventory as an example Command Line Utility, outputting the standard output to a file named Inventory.txt in the directory.

```
TMSS10Inventory -S user:-password@server -V "US01.*.*" -M 1 >
Inventory_Report.txt
```

CSV File

Excel File

PDF File

HTML File

XML File
