Upgrading TapeTrack With Database Replication

Upgrading TapeTrack with database replication procedures and requirements.

Procedure Overview

Stop master server

Stop replicant server

Upgrade master server

Upgrade replicant server

Start master server

Start replicant server

If the upgrade of either the replicant or master involves moving to another server (change of IP) you will need to update the database config files to reflect the new DNS or IP.

If the upgrade of either the replicant or master involves a change of MAC address (new server hardware or VM) you will need to apply for a new license for each Framework Server with a new MAC address.
