# Troubleshooter: Slotting (New Setup)

Slotting is not enabled by default. These are the steps required to enable slotting:

1. Create or identify an existing User-ID for the slotting task to run under.
2. Edit the Slotting.bat script located in the Scripts directory of the Framework Server Folder.
3. Update the user string to reflect the User-ID that is to be used for the task.
4. Schedule the script to run automatically via Windows Scheduler every 1 to 2 minutes.
