TMSSNOMD5

By default when TapeTrack Command Line programs send passwords to the TapeTrack Framework Server they are first MD5 hashed, and then AES encrypted along with the rest of the data that is sent with the login request.

When a TapeTrack User used Windows Active Directory authentication, TapeTrack must be able to AES decrypt the login request and then send an unhashed password to Active Directory.

When the TMSSNOMD5 environmental variable is set to any value the TapeTrack low level API will not MD5 hash the password and instead send the actual password (AES encrypted) to the Server.

Example

<sxh> set TMSSNOMD5=on </sxh>

environmental variables
